

Product Analyst - Case Study

Hey, fellow analyst! And welcome to the next step of your adventure with Wise.

This technical round is designed to give you the opportunity to understand what it's like to work and solve problems at Wise, and to demonstrate your skills and abilities.

For each question in this case study assignment, please provide concise and focused answers. Each response should be limited to one paragraph, ensuring that your answers are clear and to the point. Aim to include only the most relevant information to address the question directly.

Task 1. Analysis Review [should take up to 30 minutes]

Imagine, you are an internship program mentor at Wise. Please, review the intermediate results of analysts performed by your junior fellows below.

Project name: Understanding the impact of speed on growth

Angela is researching the impact of speed on growth. She has built a view of speed vs conversion to do the next transfer. Here is the outcome:

Speed of transfer	Conversion to next transfer in 30 days
0 – 1h	90%
1 – 12h	80%
12 – 24h	70%
24h+	69%

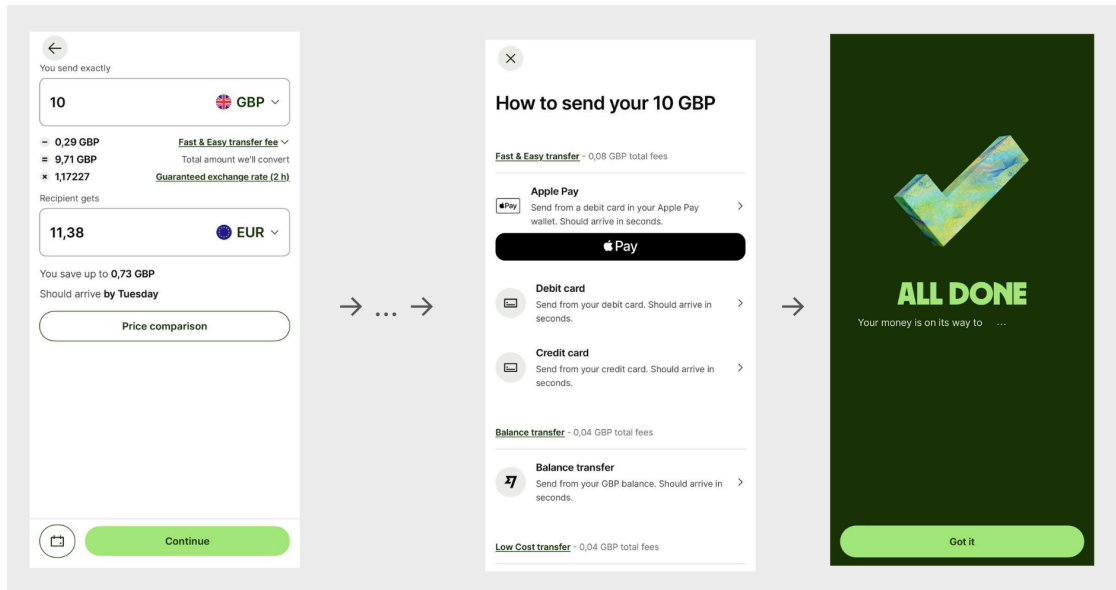

Task 1 Questions:

- 1.1. How would she interpret these results?
- 1.2. What conclusions can you infer from this data?
- 1.3. What would you recommend Angela and the Speed team to do?

Task 2. Data Analysis [should take up to 120 minutes]

Setting up an international transfer requires multiple steps from a customer. We encourage you to explore this experience yourself! Briefly, we can describe it by 3 main steps:

1. **Setting up a transfer:** choosing the source and target currencies, the sum and the recipient
2. **Paying for a transfer:** a customer should define where the money should come from – customers can pay-in from their Wise balance or external options – another Bank Account or a card.
3. **Transfer payout:** Wise routes the money to be paid out to the recipient. Once the recipient gets the funds, the transfer is considered transferred.

You will find a dataset attached to the email that has events for each step above with some dimensions.

Task 2 Questions:

- 2.1. Examine the conversion dynamics – are there any noticeable trends? If yes, what is its root cause?
- 2.2. Are there any anomalies that require the product team's attention? What could be happening in the customer experience that causes such a metric anomaly?

Dataset description

Field	Description
EVENT	Name of the step passed by a customer. One of <i>Transfer created</i> , <i>Transfer Funded</i> or <i>Transfer Transferred</i> .
DT	Date when event was fired
USER_ID	Unique identifier of a customer
REGION	Name of a geographic region the customer's profile is registered in
PLATFORM	Name of a platform (Web, iOS or Android) the customer uses while setting up a transfer
EXPERIENCE	Customer's experience by the time of setting a transfer. <i>New</i> means a customer doesn't have any previous successful transfer, <i>Existing</i> reflects the customer has finished at least 1 transfer in the past.

To save some time, skip the data quality checks – you can safely assume that event tracking data is trusted, and all inconsistencies can only have minor impact on the metrics, thus can be ignored. If you spot any anomalies, those would be insights and not the data bugs.

Tip – to query the data with SQL, you can use services like [CSVFiddle](#) or [SQLite](#).

What should you send us?

Please share your:

1. Your analysis report (e.g. Word Document, PowerPoint, Google Slides)
2. Supporting code and documents (e.g. SQL code, Python notebooks, scripts), as we'd like to understand how you arrived at your conclusions.

How do we evaluate the task?

We use the same criteria to assess the task that we use to assess our Product Analysts (you can find more on our analyst career map [here](#)). We'll be looking for:

1. **Structuring and Problem Solving:** In our work, we often encounter tasks that are not clearly defined. We encourage you to invest time in defining the problem and brainstorming ways to efficiently gather the necessary data points, employing the 80/20 approach to maximize impact with minimal effort.
2. **Actionable Insights:** In Product Analytics, our goal is to enable better decision-making. We expect your analysis to be practical and centered on the specific actions the product team should take.
3. **Effective Communication:** We value clear communication, and we encourage the use of appropriate data visualisations to effectively convey your findings.
4. **Code Quality:** We appreciate well-structured and readable code. Please ensure your code is easy to follow and understand for those reviewing it.
